

Eichhornia crassipes

water hyacinth

Eichhornia crassipes

water hyacinth

Appearance: Floating aquatic herb, rooting in mud if stranded, usually in dense mats with new plantlets attached on floating green stolons.

Leaves: Formed in rosettes; petioles to 30 cm (12 in) or more, spongy, usually inflated or bulbous, especially near base; leaf blades roundish or broadly elliptic, glossy green, to 15 cm (6 in) wide.

Flowers: Lavender-blue with a yellow blotch, to 5 cm (2 in) wide, somewhat 2-lipped; 6 petals, 6 stamens.

Fruit: A 3-celled capsule with many seeds.

Ecological threat:

Grows at explosive rates exceeding any other tested vascular plant; doubles its populations in as little as 6-18 days. In large mats, degrades water quality and dramatically alters native plant and animal communities. FLEPPC Category I

Distribution: NW, NE, C, SW, SE
