## **Annual Report of Activities Conducted under the Cooperative Aquatic Plant Control Program in Florida Public Waters for Fiscal Year 2013-2014**

This report was prepared in accordance with §369.22 (7), Florida Statutes, to provide an annual summary of plants controlled and funds expended managing aquatic plants in public waters. The Cooperative Aquatic Plant Control Program (Cooperative Program) administered by the Florida Fish and Wildlife Conservation Commission (FWC) in the state's public lakes and rivers involves complex operational and financial interactions between state, federal and local governments as well as private sector companies. The FWC has entered into 45 financial agreements (including contracts, task assignments, cooperative agreements, and purchase orders) with the aforementioned entities.

The FWC receives some federal funding through the U.S. Army Corps of Engineers (USACE) and the USACE directly funds and controls aquatic plants, employing USACE management crews in much of the St. Johns River and its tributaries. Since all of the public waters managed by the USACE are eligible for state funding through the Cooperative Program, and since the FWC occasionally assists in control operations in these waters, FWC staff monitors plant populations and control efforts and includes USACE activities in this report. Management operations and expenditures are reported for the state fiscal year that extends from July 1, 2013 - June 30, 2014, although local and federal governments and water management districts operate on a fiscal year that runs from October 1 - September 30.

Waters eligible for funding under the Cooperative Program include those on sovereignty lands accessible via public boat ramp, as well as waters that are designated Fish Management Areas and waters that lie within FWC Wildlife Management Areas. While control activities and expenditures are reported for the state fiscal year, plant presence and abundance is reported on a seasonal basis to better compare plant growth and management response through an annual growth cycle. Invasive aquatic plants are inventoried each year in Florida's 457 public lakes and rivers that cover approximately 1.25 million acres. Inventories are conducted during the peak growing period, from April through November. These inventories provide a mechanism for early detection and rapid response to control new invasive plant introductions before they become established and require long-term and large-scale management. For invasive plant populations that are already established, inventories provide information to develop management priorities and document funding needs on a statewide basis. Finally, annual aquatic plant inventories document changes in plant communities in response to management efforts as well as changes that may occur in waters where no control has been implemented.

FWC biologists work with stakeholders to identify the primary uses and functions of each public waterbody. Aquatic plant populations are inventoried at least once each year in these systems with emphasis on invasive species to determine if plants impair or may impair the identified uses and functions. Management objectives are then developed for each waterbody and funding is allocated to address statewide management priorities for the ensuing fiscal year. Managers have nearly 60 biological, herbicide, mechanical, or physical control options available to integrate into aquatic plant control strategies, adapting to the uses and functions as well as current conditions in each water waterbody. A detailed description of the uses of Florida waters, how aquatic plants may impair these uses, aquatic plant control options, management plan development, and research and outreach efforts is presented in the following website designed and maintained in a collaborative

effort between the FWC and the University of Florida, Center for Aquatic and Invasive Plants:  
<http://plants.ifas.ufl.edu/manage/>.

A summary of plant control in sovereignty public waters and associated expenditures contracted or monitored by the FWC during Fiscal Year 2013-2014 is presented in the following pages. Invasive plants were present in 96 percent of Florida's 457 public waters in 2014. Once established, eradicating invasive plants is difficult or impossible and very expensive; therefore, continuous maintenance is critical to keeping invasive plants at low levels to sustain attributes like navigation, flood control, and recreation while conserving native plant habitat for fish and wildlife on sovereignty state lands. Management statistics are summarized in Tables 1-4 and presented graphically in Figures 1-4. The FWC's highest management priorities (established in rule under section 68F-54.005 F.A.C.) are the control of floating plants (water hyacinth and water lettuce) and submersed hydrilla. "Other plants" listed in the tables include both native and nonindigenous plants that may impair the uses of Florida public waters.

Table 1 presents the amount of control and associated funding for each plant type within the boundaries of the five water management districts to provide geographical perspective on where plants are controlled in Florida. Table 2 breaks down aquatic plant management expenditures by federal and state funds. Fourteen aquatic plant species found in Florida are considered to be invasive in that they are capable of causing environmental or economic harm if not managed on a routine basis. Some are widespread like floating plants or hydrilla and are under continuous maintenance. Others are present in only a few locations and are under eradication or containment programs to prevent them from becoming established in Florida waters. Table 3 lists the fourteen invasive aquatic plants found in Florida public waters, summarizing acres controlled and associated control expenditures for Fiscal Year 2013-2014. Table 4 lists management expenditures by waterbody, including assessment and monitoring costs.

Figure 1 shows the ranges in size of the floating plant populations reported in Florida public lakes and rivers in 2014. Although these plants are widespread, found in 249 public waters, most populations are being suppressed to fewer than ten acres, keeping overall management costs and environmental impacts at low levels. Figure 2 shows water hyacinth cover in Florida public waters in approximately ten-year intervals dating from 1947 through 2014 to give an historical perspective of the presence of this prolific plant species through the decades. The Maintenance Control management philosophy was implemented for floating plant control in the early 1970s. Under this management strategy, invasive plants are controlled on a statewide, routine and consistent basis, keeping them at levels where they do not impair the identified uses or functions of individual waterbodies. Since implementing maintenance control efforts, the overall floating plant population has been reduced from about 125,000 acres in 1959 to a few thousand acres at any one time for the past 35 years. Floating plants were evaluated to be under maintenance control in 99 percent of Florida's 457 public waters during 2014.

Figure 3 shows acreage ranges for the 185 hydrilla populations that were identified in public lakes and rivers during 2014. Seventy-eight percent of all hydrilla populations observed in 2014 covered fewer than ten acres, and 98 percent of Florida's 457 public waters were considered to be under maintenance control in regards to hydrilla during 2014. Figure 4 compares funding for hydrilla control vs. acres of hydrilla inventoried in public waters from 1982-2014. When funding is adequate, hydrilla can be suppressed at low levels. When funding is insufficient, hydrilla expands and forms underground tubers that can persist for many years, representing the potential for

immediate regrowth after control, and the need for prolonged higher levels of management funding until these tuber “banks” are depleted.

Most of the aquatic plant control achieved by the FWC is through the use of herbicides registered for use in water by the U.S. Environmental Protection Agency and the Florida Department of Agriculture and Consumer Services. The FWC authorizes herbicide use for aquatic plant control under coverage of Generic Permit #FLG510039-IWPG issued by the Florida Department of Environmental Protection pursuant to National Pollutant Discharge Elimination System (NPDES) regulations. The Generic Permit requires entities responsible for applying herbicides to waters of the U.S. to take measures to reduce herbicide use. The FWC meets this obligation by integrating non-chemical technologies (especially biological controls) where possible under maintenance control programs to keep invasive and nuisance plants under control in Florida public waters. Nearly all of Florida’s public lakes and rivers are under maintenance control in regards to invasive hydrilla and floating aquatic plants. The FWC continues to meet management objectives for these species while reducing overall control expenditures and herbicide use. When these highest priority species are under maintenance control, additional funding can be directed toward managing emergent and upland invasive plant species to further conserve or enhance fish and wildlife habitat.

## Year in Review - Fiscal Year 2013-2014

- Invasive non-native plants were found in 96 percent of Florida's 457 public lakes and rivers that comprise 1.25 million acres of fresh water.
- Eradicating established invasive aquatic plant populations has proven nearly impossible; therefore, routine maintenance is needed to suppress invasive plants at low levels to sustain attributes like navigation, flood control, and recreation while conserving native plant habitat.
- Floating water hyacinth and water lettuce, two of the world's fastest growing and most invasive plants, covered as much as 125,000 acres of Florida public waters as recently as 1960 and therefore, are the FWC's highest aquatic plant management priorities.
- Floating plants were present in 249 public lakes and rivers in 2014 covering 4,578 acres and are under maintenance control in 99 percent of Florida's public waters. Eighty-four percent of the floating plant populations found in 2014 covered 10 acres or less. (Figure 1)
- Approximately \$5.12 million were spent controlling more than 43,000 acres of floating plants in Florida public lakes and rivers during Fiscal Year 2013-2014 (Tables 1-3).
- Submersed hydrilla, imported during the 1950s as an aquarium plant, is capable of growing several inches per day, filling the water column and covering the surface of water bodies that are not frequently and routinely managed.
- Insufficient funding allowed hydrilla to evolve into statewide water and habitat management crises by the mid-1990s, infesting nearly 100,000 acres in 365 (80 percent) of Florida's public lakes and rivers. Sufficient, recurring funding and improved technology aided by FWC-funded research enabled FWC contractors to reduce hydrilla to about 21,840 acres in 2014. (Figure 4)
- Hydrilla was reported in 185 public waters in 2014 and is considered to be under maintenance control in 98 percent of Florida's public lakes and rivers; however, subterranean tubers still infest about 60,000 acres and represent the potential for immediate regrowth.
- Seventy-eight percent of the hydrilla populations found in 2014 covered 10 acres or less (Figure 3). Sixty-one percent of the hydrilla acreage reported during FWC inventories of public lakes and rivers during 2014 occurred in the four lakes of the Kissimmee Chain of Lakes.
- The FWC spent \$5.34 million treating 9,000 acres of hydrilla in public waters during Fiscal Year 2013-2014 to conserve the multiple uses of these resources (Tables 1-3). This is \$12.2 million less than the peak hydrilla control expenditure in Fiscal Year 2002-2003 (Figure 4).
- Fourteen of the 28 non-native aquatic plants found in Florida public waters are considered to be invasive, capable of disrupting aquatic ecosystems and causing economic or environmental harm. Nine invasive species in addition to hydrilla, water hyacinth, and water lettuce were found in 94 percent of Florida's public waters, covering about 16,160 acres during 2014.
- \$3.93 million were spent controlling about 8,000 acres of aquatic plants other than hydrilla and floating plants during Fiscal Year 2013-2014 (Tables 1-3). Most of the control was for the tussock-forming plants large-flower primrose and Cuban club rush in the Kissimmee Chain of Lakes and Lake Okeechobee, and floating islands in Tsala Apopka to conserve fish and wildlife habitat.

## Fiscal Year 2013-2014 Management Statistics

**Table 1: Acres of Aquatic Plants Treated and Treatment Expenditures in Florida Public Waters during Fiscal Year 2013 - 2014 Listed by Control within Each Water Management District.**

Acres	Northwest	Suwannee	St Johns	Southwest	S. Florida	TOTAL

Floating islands		
<b>Total</b>	<b>65,161.46</b>	<b>\$14,383,067.45</b>

## Floating Plants

**Figure 1: Number of Public Lakes and Rivers in which Floating Plants Were Reported in 2014; Reported by Range of Population Size.**

154 of the 249 floating plant populations reported in 2014 covered less than one acre. This is significant in that nearly all floating plant populations are under maintenance control. Waters with large floating plant levels reported in 2014 are high priorities to regain control in 2015.

**Figure 2: Acres of Water Hyacinth Reported in Florida Public Lakes and Rivers from 1947-2014.**

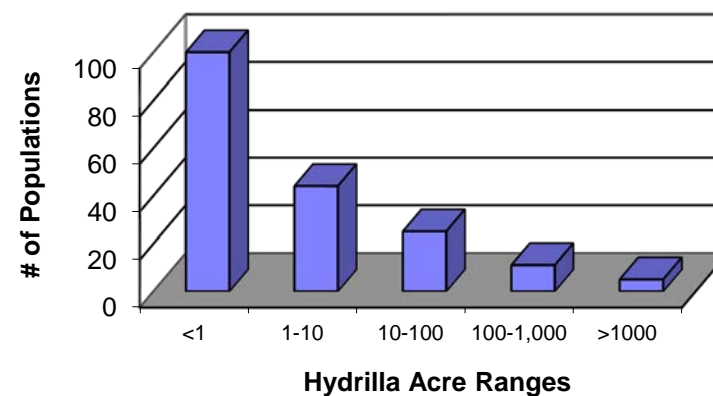

Water hyacinth reached its apex, covering more than 125,000 acres in the early 1960s. Frequent and consistent management efforts coordinated on a statewide basis have allowed managers to reduce the standing crops of water hyacinth and water lettuce to low levels where they do not impair the multiple uses of Florida waters.

## Hydrilla

**Figure 3: Number of Public Lakes and Rivers in which Hydrilla Was Reported in 2014; Reported by Range of Population Size.**

144 of the 185 hydrilla populations reported in 2014 covered 10 acres or less, signifying that most that are under maintenance control are also at very low levels. Populations exceeding 100 acres are higher management priorities for 2015.

**Figure 4: Acres Reported and Dollars Spent Managing Hydrilla in Florida Public Lakes and Rivers from 1982-2014.**

When funds are sufficient, hydrilla can be managed at a low level. When funds decline, hydrilla expands to a higher level requiring additional recurring funding for control. Hydrilla reached its apex in Florida public waters in 1994, covering nearly 100,000 acres. Although the standing crop in the collective 185 waters in which hydrilla was reported in 2014 totaled about 21,836 acres, underground tubers, that represent hydrilla’s ability to immediately sprout and refill the water column, are estimated at about 60,000 acres. Therefore, FWC must remain diligent in controlling this highly invasive aquatic plant to prevent it from impairing Florida public waters. Suppressing hydrilla allows diverse native plant communities to flourish and conserves recreational uses. Additionally, sustaining low levels of hydrilla through time reduces taxpayer management expenses and allows FWC to meet its federal obligations to reduce herbicide use in Florida waters.

**Table 4. Plants Controlled and Management Expenditures by Waterbody in Florida Public Waters during Fiscal Year 2013-2014**

**Table 4 Key**

Waterbody	Name of public waterbody
FMA	Fish Management Area
WMA	Wildlife Management Area
Waterbody Acres	Surface acres of public waterbody
Contractor	Agency or company that conducts aquatic plant management
AAM	Applied Aquatic Management, Inc.
AVC	Aquatic Vegetation Control, Inc.
Brevard	Brevard County
Citrus	Citrus County
Coastal	Coastal Air Services, Inc.
FEC	Florida Environmental Consultants, Inc.
Highlands	Highlands County
Hillsborough	Hillsborough County
Lake	Lake County
Orange	Orange County
Palm Beach	Palm Beach County
Polk	Polk County
SFWMD	South Florida Water Management District
SJRWMD	St. Johns River Water Management District
SWFWMD	Southwest Florida Water Management District
USACE	U.S. Army Corps of Engineers
Winter Park	City of Winter Park
County	County in which the waterbody lies (Note: many waterbodies lie in more than one county, for example: the St. Johns River lies in 11 counties, but for reporting purposes has been assigned to St. Johns County)
WMD	Water Management District in which the waterbody lies
Plant Type	Scientific name or type of plant - note: Floating = water hyacinth and/or water lettuce Tussocks = floating mats of mixed emergent plants Trees = fallen trees that block access or navigation
FY 13-14 Acres Treated	Acres of plants managed during fiscal year 2013-2014 (note: acreage not listed for tree removal)
FY 13-14 Dollars Spent	Dollars spent managing plants - includes control, assessment, monitoring, and administrative costs during fiscal year 2013-2014
